**Lund et al. Hospital contact for mental disorders in survivors of childhood cancer and their siblings in Denmark: a population-based cohort study. 2013**

Study Design Treatment era Years of follow-up	Participants	Main outcomes	Quality assessment Remarks
<p><b>Study Design:</b></p> <p><input type="checkbox"/> Cross-sectional study</p> <p><input type="checkbox"/> Case-control study</p> <p><input checked="" type="checkbox"/> Cohort study</p> <p><input type="checkbox"/> Qualitative study (→ exclude!)</p> <p><input type="checkbox"/> Systematic/narrative review (→ exclude!)</p> <p><input type="checkbox"/> RCT</p> <p><input type="checkbox"/> Other: (specify!)</p> <p><b>Treatment era:</b> 01.01.1975-15.12.2009</p> <p><b>Years of follow-up:</b> The follow-up extended to 37 years, with a median of 8-82 (IQR 2-41–19-25) years for childhood cancer survivors and 17-32 (2-99–26-25) years for comparisons.</p> <p><b>Country:</b> Denmark, nationwide registry study</p> <p><b>Measurement tool:</b> Hospital contacts for mental disorders registered in the Danish Psychiatric Central Registry (This contains dates and complete discharge diagnoses for all inpatient contacts to Danish psychiatric departments since April, 1969, and all outpatient contacts since 1995. All diagnoses of mental disorders from 1975 to 2011 were categorised into two main groups: psychotic disorders, consisting of the subcategories of organic psychosis, schizophrenia and other psychoses, and bipolar depression; and nonpsychotic disorders, including other affective disorders (mainly unipolar depression), anxiety, personality disorder, and two groups we defined for this study: “neurodevelopmental and other non-psychotic organic disorders” and “emotional and behavioural disorders”. The latter group consisted of mental and behavioural disorders related to psychoactive substance misuse, diagnoses of emotional and behavioural disorder specific to childhood and adolescence (except for attention deficit hyperactivity disorder, which was categorised in the group of neurobehavioural disorders), and emotional and behavioural reactions and syndromes (appendix). Multiple diagnoses in the same person were recorded, but only the first contact within each main diagnostic group (or subgroups within main groups) was counted. If a person had had a contact for a psychotic disorder, any subsequent non-psychotic disorder was disregarded.)</p>	<p><b>Sample size:</b> N=7085 (82331 person-years)</p> <p><b>Diagnoses:</b> Leukaemia: 1707 (24) Lymphoma: 904 (13%) Central nervous system (CNS) tumours: 1774 (25%) Neuroblastoma and other tumours of the sympathetic nervous system: 317 (5%) Retinoblastoma: 136 (2%) Renal tumours: 257 (4%) Hepatic tumours: 66 (1%) Malignant bone tumours: 347 (5%) Soft-tissue sarcomas: 404 (6%) Germ-cell, trophoblastic and other gonadal tumours: 503 (7%) Carcinomas and other malignant epithelial neoplasms: 580 (8%) Other and unspecified malignant neoplasm: 90 (%)</p> <p><b>Age at diagnosis:</b> 0-4: 2198 (31%), 5-9: 1294 (18%), 10-14:1338 (19%), 15-19: 2255 (32%)</p> <p><b>Age at study:</b> Not reported</p> <p><b>Controls:</b> 13105 siblings (225793 person-year) respectively 140534 (2508513 person-year) population based survivor comparisons (of whom have had 251578 (4307009 person year) sibling comparisons)</p>	<p><b>Risk:</b> The excess absolute risk for hospital contact for mental disorders was: 0.92 contacts per 1000 person-years for male survivors of childhood cancer (95% CI: 0.30–1.54) and 0.84 for females (95% CI: 0.24–1.46) in the period with only inpatient contacts (1975–1994).</p> <p>The excess absolute risk during 1995–2009 was 2.25 contacts per 1000 person-years for males (95% CI: 1.45–3.04) and 1.26 for females (95%CI: 0.26–2.26) including both inpatient and outpatient contacts.</p> <p>With the population-based comparisons as reference, we noted a Hazard Ratio for a first hospital contact in male survivors of 1.50 (95% CI: 1.32–1.69) and of 1.26 (1.10–1.44) in females.</p> <p>In the analyses of both sexes combined, the Hazard Ratio for any hospital contact in survivors was 1.38 (95% CI: 1.26–1.51).</p> <p>When survivors were compared directly with their siblings, the risk estimates slightly decreased (1.31, 1.13–1.51 for males and 1.13, 0.97–1.33 for females).</p> <p>Overall, no increased risk for hospital contact was noted for brothers (HR 0.99, 95% CI: 0.91–1.08) or sisters (1.01, 0.93–1.10) of survivors, or for any specific psychiatric subtype</p>	<p><b>Quality assessment:</b></p> <p>1. ### 3. How sensitive are commonly used diagnostic tools for self-reported, parent-reported, different age groups, format and different clinical issues?

**Maurice-Stam et al. Measuring perceived benefit and disease-related burden in young cancer survivors: validation of the Benefit and Burden Scale for Children (BBSC) in The Netherlands. 2011**

Study Design Treatment era Years of follow-up	Participants	Diagnostic tool	Main outcomes	Quality assessment Remarks
<p><b>Study Design:</b>  <input checked="" type="checkbox"/> Cross-sectional study  <input type="checkbox"/> Case-control study  <input type="checkbox"/> Cohort study  <input type="checkbox"/> Qualitative study (→ exclude!)  <input type="checkbox"/> Systematic/narrative review (→ exclude!)  <input type="checkbox"/> RCT  <input checked="" type="checkbox"/> Other: (specify!) Including re-test</p> <p><b>Treatment era:</b>  December  2008 to February 2009</p> <p><b>Years of follow-up:</b>  time since diagnosis M=3.2 (SD=1.4); time since the end of treatment M=1.8 (SD=0.9)</p> <p><b>Country:</b>  The Netherlands</p> <p><b>Study center:</b>  Emma Children's Hospital AMC,  VU University Hospital, Radboud University Nijmegen Medical Centre, Leiden University Medical Centre</p>	<p><b>Sample size:</b>  126 invited  77 first assessment  69 re-test assessment</p> <p><b>Diagnoses:</b>  leukaemia or lymphoma: 64.9%,  solid tumour: 27.3%,  CNS cancer: 7.8%</p> <p><b>Age at diagnosis:</b>  mean=10.2 years</p> <p><b>Age at study:</b>  Not specified</p> <p><b>Treatment:</b>  Chemotherapy (98.7%)  Surgery (58.4%) Radiotherapy (36.4%)</p> <p>Some (14.3%) of the children were treated for a relapse of the cancer.</p>	<p>Benefit and Burden Scale for Children ((BBSC: 20-item self-report instrument for children 7+ years. The items describe potential benefit (10 items) or burden (10 items) of illness with a five-point Likert scale ranging from 1 'not at all true for me' to 5 'very true for me'. Items include affect, relationships with peers and family relationships.))</p> <p>Higher scores indicate higher benefit and burden (scale range 10–50). The BBSC has shown to be reliable and valid in an American childhood cancer population with benefit and burden as independent constructs. The Dutch version of the BBSC was established by a forward– backward translation.</p> <p>Further instruments:</p> <ul style="list-style-type: none"> <li>• PedsQL - Pediatric Quality of Life Inventory (PedsQL) GenericCore Scales</li> <li>• STAI-C - State-Trait Anxiety Inventory for Children</li> <li>• CRIES - Children's Revised Impact of Event Scale</li> <li>• SDQ- Strengths and Difficulties Questionnaire for children aged 11–16 years</li> </ul>	<p><b>Sensitivity:</b> N.a.  <b>Specificity:</b> N.a.</p> <p><b>Reliability</b>  Good internal consistency (benefit: <math>\alpha=0.84</math>; burden: <math>\alpha=0.72</math>). Satisfactory test–retest reliability, measured with a mean interval of 21 days: Pearson's correlation coefficient benefit: 0.74 and burden: 0.78.</p> <p>Homogeneity indexes were satisfactory: mean inter-item correlation for benefit (0.34) and burden (0.22). Item-total correlation for benefit was satisfactory (0.34-0.71). Item-total correlation for burden was less satisfactory (0.08-0.50) caused by item 18 ('I worry that I will bring other people down or upset them'). Deleting item 18 yielded item–total correlation for burden (0.35-0.50).</p> <p><b>Construct validity</b>  Burden correlated strongly (<math>r \geq 0.5</math>; <math>p &lt; 0.001</math>) with 11 out of 15 psychological outcomes. Higher levels of burden were associated with lower HRQoL, higher levels of anxiety, more posttraumatic stress symptoms and more behavioural problems. Benefit did not correlate with any psychological outcome.</p> <p>The authors conclude that the BBSC-Dutch version demonstrated "satisfactory internal consistency, test–retest reliability and homogeneity, though the item–total correlations of the Burden scale would rise when item 18 ('I worry that I will bring other people down or upset them') would be removed. The results of our study support the construct validity of the Dutch version of the BBSC. In line with the American version of the BBSC, disease-related burden was strongly associated with almost all psychological outcomes, while benefit finding was not."</p>	<p><b>Quality assessment:</b>  1. Is the study group representative?  <input type="checkbox"/> Yes/<input checked="" type="checkbox"/> no/  <input type="checkbox"/> unclear  2. Is the follow-up adequate?  <input type="checkbox"/> Yes/<input type="checkbox"/> no/  <input checked="" type="checkbox"/> unclear  3. <p><b>Study Design:</b> <input checked="" type="checkbox"/> Cross-sectional study <input type="checkbox"/> Case-control study <input type="checkbox"/> Cohort study <input type="checkbox"/> Qualitative study (→ exclude!) <input type="checkbox"/> Systematic/narrative review (→ exclude!) <input type="checkbox"/> RCT <input type="checkbox"/> Other: (specify!)</p> <p><b>Treatment era:</b> n.a.</p> <p><b>Years of follow-up:</b> Time since diagnosis = 2.6-30.3 years (median 14.9 years)</p> <p><b>Country:</b> USA</p> <p><b>Study center:</b> Multi-institutional study (three institutions)</p>	<p><b>Sample size:</b> N=119</p> <p><b>Diagnoses:</b> Leukemias : n= 42, 35.3% Lymphomas: n= 29, 24.4% Sarcomas: n= 26, 21.8% Other solid tumors: n= 22, 18.5%</p> <p><b>Age at diagnosis:</b> Median age at diagnosis = 11.2 years (range: birth-19 years)</p> <p><b>Age at study:</b> Median age = 23.5 years (range: 18-45)</p> <p><b>Treatment:</b> n.a.</p>	<p><b>Distress thermometer</b> The DT is a single-item, self-reported measure of psychological distress. This visual-analogue scale has scores from 0 ‘no distress’ to 10 ‘extreme distress’. Using the scale, patients were asked to rate how distressed they felt in the past week.</p> <p><b>SCL-90-R</b> The SCL-90-R is a 90-item self-report symptom checklist. Respondents rate items on a five-point scale reflecting their distress during the past 7 days. Scores are generated for nine symptom scales and an overall Global Severity Index (GSI). Using gender-specific normative data, scores are transformed into T-scores. Cases are defined as clinical according to the SCL-90-R standard rule with GSI T-score, or any of two subscale T-scores ≥ 63. It was chosen as the criterion measure against which to compare the DT because of its superior reliability and extensive validation in psychiatric, medical, and oncology samples.</p>	<p><b>Sensitivity:</b> Using the NCCN recommended cut-off score of 5, the DT identified 20 of the 36 SCL-90-R cases. <b>Sensitivity was 55.6%</b>, specificity was 80.7%. Using the alternative cut-off score of 4, the DT identified 23 of the SCL-90-R cases; <b>sensitivity improved to 63.9%</b> and specificity dropped to 65.1%.</p> <p><b>Specificity:</b> Using the NCCN recommended cut-off score of 5, the DT identified 20 of the 36 SCL-90-R cases. Sensitivity was 55.6%, <b>specificity was 80.7%</b>. Using the alternative cut-off score of 4, the DT identified 23 of the SCL-90-R cases; sensitivity improved to 63.9% and <b>specificity dropped to 65.1%</b>.</p> <p><b>Other psychometric properties (specify):</b> In the ROC analysis AUC was 0.72, indicating the DT had only fair diagnostic utility relative to the SCL-90-R. Finally, each DT score was evaluated as a potential cut-off score by calculating its sensitivity and specificity with the SCL-90-R criterion. No cut-off score met the criteria of sensitivity ≥0.90 and specificity ≤0.75 set for this study.</p> <p><b>Sensitivity and Specificity values of distress thermometer cut-off scores</b></p> <table><tr><th>DT</th><th>Sensitivity (%)</th><th>Specificity (%)</th></tr><tr><td>≥ 0</td><td>100</td><td>0</td></tr><tr><td>≥ 1</td><td>88.9</td><td>21.7</td></tr><tr><td>≥ 2</td><td>86.1</td><td>30.1</td></tr><tr><td>≥ 3</td><td>77.8</td><td>48.2</td></tr><tr><td>≥ 4</td><td>63.9</td><td>65.10</td></tr><tr><td>≥ 5</td><td>55.6</td><td>80.7</td></tr><tr><td>≥ 6</td><td>47.2</td><td>88.0</td></tr><tr><td>≥ 7</td><td>33.3</td><td>92.8</td></tr><tr><td>≥ 8</td><td>25.0</td><td>97.6</td></tr><tr><td>≥ 9</td><td>10.8</td><td>100</td></tr><tr><td>≥ 10</td><td>8.3</td><td>100</td></tr></table>	DT	Sensitivity (%)	Specificity (%)	≥ 0	100	0	≥ 1	88.9	21.7	≥ 2	86.1	30.1	≥ 3	77.8	48.2	≥ 4	63.9	65.10	≥ 5	55.6	80.7	≥ 6	47.2	88.0	≥ 7	33.3	92.8	≥ 8	25.0	97.6	≥ 9	10.8	100	≥ 10	8.3	100	<p><b>Quality assessment:</b> 1. #### 4. What are the most effective interventions in the treatment of mental health disorders in CAYA survivors?

**Barrera et al. A group social skills intervention program for survivors of childhood brain tumors. 2009**

Study Design Treatment era Years of follow-up	Participants	Intervention	Main outcomes	Quality assessment Remarks
<p><b>Study Design:</b>  <input type="checkbox"/> Cross-sectional study  <input type="checkbox"/> Case-control study  <input checked="" type="checkbox"/> Cohort study  <input type="checkbox"/> Qualitative study (→ exclude!)  <input type="checkbox"/> Systematic/ narrative review (→ exclude!)  <input type="checkbox"/> RCT  <input type="checkbox"/> Other: (specify!)</p> <p><b>Treatment era:</b> 2000-2006</p> <p><b>Years of follow-up:</b>  <b>Time off therapy:</b>  <b>M= 5.30 years (SD=4.12)</b>  <b>Range: 0.42-15 years</b></p> <p><b>Country:</b> Canada</p> <p><b>Study center:</b> Neuro-oncology in a large pediatric center, Toronto</p> <p><b>Measurement tool:</b> Pre-intervention, baseline, post-intervention, &amp; 6 month follow-up. Mental health measures included the Child Behavior Checklist (CBCL), Youth Self Report (YSR), &amp; Child Depression Inventory (CDI).</p>	<p><b>Sample size:</b> N=32 n=17 ≤12 children and n=15 &gt;12 adolescents</p> <p><b>Diagnoses:</b> Brain tumor: Medulloblastoma- 9 (28%) Astrocytoma- 6 (19%) Other- 3 (53%)</p> <p><b>Age at diagnosis:</b> Mean=7.31 years</p> <p><b>Age at study:</b> Mean=12.6 years</p> <p><b>Treatment:</b> Surgery- 11 (34%) Radiation- 0 (0%) Chemotherapy- 1 (3%) Surgery &amp; radiation- 2 (6%) Surgery &amp; chemotherapy- 3 (9%) Radiation &amp; chemotherapy- 2 (6%) Surgery, radiation, &amp; chemotherapy- 12 (38%) No treatment- 1 (3%)</p>	<p>6 groups with 4-7 children: 2h group sessions once a week for 8 weeks. Supervised by a psychologist.</p> <p>First 6 sessions:  a) Pre-activities: keep participants occupied upon arrival, provide the opportunity for informal verbal interaction  b) Review: refresh the learning acquired in the previous session through discussion of homework, and re-involving any participant who might have missed the previous session;  c) Mental Set Activity, the first specific activity of each session addresses the theme/social skills of that session and aims to focus participant's attention, interest, motivation and curiosity into thinking about the session's theme and social skill  d) Social Skills, each skill is taught by implementing the "Tell" phase, in which the facilitator introduces skills by describing and asking questions, involves group participants, provides rationale for the importance of the skills, and outlines the specific skills steps, followed by the "Show" phase, which involves the facilitators' modeling the behavior positively and negatively by role-playing with active involvement of group participants, followed by role-playing of positive or negative behavior by participants and finally a discussion of the role-play  e) Snack, 10min break  f) Main Activity, designed to consolidate the social skill learned  g) Homework: practice at home and school the social skill learnt in the session</p> <p>Seventh session: review of all previous skills both in the regular structured setting and in an unstructured setting (playground).</p> <p>Final session: practicing skills and preparation for graduation ceremony = describing to parents what was learnt.</p> <p>Skills: social initiation and friendship making; cooperation, managing teasing and bullying, conflict resolution; empathy; and assertion with self-confidence building.</p>	<p>Treatment fidelity: 88% adherence to session outline, 87% adherence to session themes and 83% successful engagement in the activities by participants.</p> <p>Parent report:</p> <p>Analysis of CBCL total change scores using a Bonferroni correction (n=4; p=.0125) revealed a borderline main effect for time [F(2,52)=3.29, p&lt;.05]; however post-hoc pairwise comparisons found no significance between baseline and pre-intervention or pre- and post-intervention with a Bonferroni correction.</p> <p>Survivors:</p> <p>Internalizing: Survivors' reports of internalizing behavior on YSR revealed no significant effects except for a borderline time change [F(2,24)=3.89, p&lt;.05]. The change was significant from baseline to pre-intervention [F(1,13)=11.25, p&lt;.01] with survivors scores decreasing from baseline to pre-intervention. There was no significant effect from pre- to post-intervention.</p> <p>Depression: Survivor's scores on the CDI revealed no significant time differences. Survivors' scores at baseline were not significantly different from normative values and remained consistent across the investigation.</p>	<p><b>Quality assessment:</b>  1. Is the study group representative?  <input type="checkbox"/> Yes/<input checked="" type="checkbox"/> no/  <input type="checkbox"/> unclear  2. Is the follow-up adequate?  <input checked="" type="checkbox"/> Yes/<input type="checkbox"/> no/  <input type="checkbox"/> unclear  3. Are the outcome assessors blinded?  <input type="checkbox"/> Yes/<input checked="" type="checkbox"/> no/  <input type="checkbox"/> n.a./<input type="checkbox"/> unclear  4. Are the analyses adjusted for important confounding factors?  <input checked="" type="checkbox"/> Yes/<input type="checkbox"/> no/  <input type="checkbox"/> unclear</p> <p><b>Remarks:</b> Participants referred to social skills group due to observed deficits, social withdrawal, or bullying</p>

#### 4. What are the most effective interventions in the treatment of mental health disorders in CAYA survivors?

**Kazak et al. Treatment of posttraumatic stress symptoms in adolescent survivors of childhood cancer and their families: a randomized clinical trial. 2004**

Study Design Treatment era Years of follow-up	Participants	Intervention	Main outcomes			Quality assessment Remarks																																	
<b>Study Design:</b> <input type="checkbox"/> Cross-sectional study <input type="checkbox"/> Case-control study <input type="checkbox"/> Cohort study <input type="checkbox"/> Qualitative study (→ exclude!) <input type="checkbox"/> Systematic/narrative review (→ exclude!) <input checked="" type="checkbox"/> RCT <input type="checkbox"/> Other: (specify!)	<b>Sample size:</b> 150 cancer survivors, 146 mothers, and 106 fathers  <b>Diagnoses:</b> Leukemias (25%), solid tumors (22%), lymphoma (21%), bone tumors (8%), and other (24%)  <b>Age at diagnosis:</b> Median: 7.80 yrs Range: 2.76–16.36  <b>Age at study:</b> Median: 14.32 yrs Range:10.80–19.28  <b>Treatment:</b> Not reported	The Surviving Cancer Competently Intervention Program (SCCIP) is a four-session, 1-day manualized intervention to reduce PTSS in adolescent survivors of childhood cancer and their families that uses a family group treatment model. The 76 families received active treatment and 74 families were part of a wait-list control group.  Session 1 – how cancer has affected me and my family  Session 2 – coping skills  Session 3 – Getting on with life- cancer, adolescents, and families  Session 4 – Pulling it all together – family health and our future	Due to meaningfully missing data, mean imputation was used to account for missing data. Five imputations were calculated and the results averaged to form the means and 95% confidence intervals (CIs) reported here; higher scores indicate greater reduction of symptoms. T-tests were performed on the mean of the imputed difference scores derived from transformed data. Survivors in the intervention group improved more on symptoms of arousal than did teen survivors in the control group, $t(20) = 3.13$ , $p < 0.01$ .  No others significant changes were observed on IES-R Intrusion or Avoidance subscales, the Post-Traumatic Stress Disorder Reaction Index (PTSD-RI), or the Revised Children’s Manifest Anxiety Scale (RCMAS) No group differences were evident for the teens (treatment $M_{\text{difference}} = 2.38$ , $SD = 9.60$ , vs. control $M_{\text{difference}} = 1.57$ , $SD=9.10$ ), $t(110) = 0.46$ , $p = 0.65$ <table><tr><th></th><th>Survivors- Intervention</th><th>Survivors-Control Group</th></tr><tr><th></th><th>M (95% CI)</th><th>M (95% CI)</th></tr><tr><td>IES-R Intrusion</td><td>3.15 (1.59-4.72)</td><td>1.57 (-0.44-3.57)</td></tr><tr><td>IES-R Avoidance</td><td>3.33 (1.32-5.34)</td><td>4.18 (2.42-5.94)</td></tr><tr><td>IES-R-Arousal</td><td>3.51 (1.86-5.16)</td><td>1.35 (-0.30-3.00)</td></tr><tr><td>PTSD-RI</td><td>6.53 (4.11-8.96)</td><td>4.49 (1.97-7.01)</td></tr></table> <table><tr><th>Group comparisons</th><th><i>t</i></th><th><i>p</i></th></tr><tr><td>IES-R Intrusion</td><td><math>t(140) = 1.32</math></td><td>0.19</td></tr><tr><td>IES-R Avoidance</td><td><math>t(145) = 0.66</math></td><td>0.51</td></tr><tr><td>IES-R-Arousal</td><td><math>t(143) = 2.77</math></td><td>0.01</td></tr><tr><td>PTSD-RI</td><td><math>t(143) = 1.21</math></td><td>0.23</td></tr></table>				Survivors- Intervention	Survivors-Control Group		M (95% CI)	M (95% CI)	IES-R Intrusion	3.15 (1.59-4.72)	1.57 (-0.44-3.57)	IES-R Avoidance	3.33 (1.32-5.34)	4.18 (2.42-5.94)	IES-R-Arousal	3.51 (1.86-5.16)	1.35 (-0.30-3.00)	PTSD-RI	6.53 (4.11-8.96)	4.49 (1.97-7.01)	Group comparisons	<i>t</i>	<i>p</i>	IES-R Intrusion	$t(140) = 1.32$	0.19	IES-R Avoidance	$t(145) = 0.66$	0.51	IES-R-Arousal	$t(143) = 2.77$	0.01	PTSD-RI	$t(143) = 1.21$	0.23	<b>Quality assessment:</b> 1. Is the study group representative? <input type="checkbox"/> Yes/ <input type="checkbox"/> no/ <input checked="" type="checkbox"/> unclear 2. Is the follow-up adequate? <input type="checkbox"/> Yes/ <input type="checkbox"/> no/ <input checked="" type="checkbox"/> unclear 3. Are the outcome assessors blinded? <input type="checkbox"/> Yes/ <input type="checkbox"/> no/ <input checked="" type="checkbox"/> n.a./ <input type="checkbox"/> unclear 4. Are the analyses adjusted for important confounding factors? <input checked="" type="checkbox"/> Yes/ <input type="checkbox"/> no/ <input type="checkbox"/> unclear  <b>Remarks:</b>  Q1. Of the 330 contacted confirmed-eligible families, 150 (45%) enrolled in the study. Those declining participation were able to indicate one or more reasons for refusal: 46% (N=70) indicated that they did not want to revisit the cancer experience; 61% (N=94) cited time and scheduling difficulties. No sig differences were found between participants & nonparticipants with regard to the survivor age, time since treatment, gender, ethnicity and diagnosis.  Q2. Overall attrition is 22.67% which meets criteria- but attrition was 38% for intervention group (does not meet criteria) & 7% for waitlist control group.
	Survivors- Intervention	Survivors-Control Group																																					
	M (95% CI)	M (95% CI)
